CS598 Course Project Progress Report: End-to-End Data Curation Workflow

Team: Jephtha Davenport (wjd4@illinois.edu)

Project Summary Scientific examination of human consciousness has increased publication volume across fields and remains to be organized.¹ The project undertaken for this course aims to create a database of relevant publications in the field of consciousness using the first four steps of the USGS lifecycle model² for a cumulative dataset.

Status Stages of Plan, Acquire, Process, and Analyze have begun. This interim progress report describes the status of deliverables. Artifacts generated so far are accessible publicly at the following repository: <https://github.com/wjdavenport/FDC-Project-Backup>

N.B. One-time dataset storage occurs in a pinned submodule, for archival purposes: <https://github.com/wjdavenport/FDC-Project-Data>

Please refer to the Project Proposal document previously submitted and archived in the repository for additional preceding details.³

Plan Progress: in a modification to the Project Proposal, the Acquire stage increased the date range for an initial search of PubMed (1996 to 2025) to 1843 to 2025 (retrieval date fixed at 2025-09-27). The reason for the increase in range was that the effort required to capture extra publications dated from 1843-1995 was not excessive given the long leftward tail of an exponentially increasing annual publication rate, and the earlier date marks the current limit of PubMed's earliest publications (Figure 1). With this modification, the total number of publications captured in the PubMed search was just over 65,000, which was well within the Project Proposal estimates ($< 10^6$).

Figure 1. Frequency of Publications including "Consciousness" in PubMed by Year

Acquire Progress: a programmatic acquisition was accomplished following the National Library of Medicine Entrez Programming Utilities (E-utilities) guidelines.⁴ Limits followed included not making more than three URL requests per second and performing the requests during off-hours (weekends and 21:00-05:00 Eastern

Figure 2. Interim analysis of weighted n-grams for relevance of flagged articles including “consciousness”

Time). Although the search was performed with an active ORCID (available through no-cost registration⁵) through an NCBI api key (also available at no-cost with registration⁶), it would be possible for subsequent researchers to perform the same search without registration. Finally, to avoid overly large download blocks (i.e., respecting the 10k idlist limit), a helper routine was created with an output log of the date-count ranges used to keep within such a limit. The R code used is kept at: `acquire/r-project/01_download_pubmed_consciousness.R` within the public GitHub repository⁷ as well as on a personal storage device.

Process Progress: a Python script was created to convert the .medline file to .csv format (https://github.com/wjdavenport/FDC-Project-Backup/consciousness-ezr/scripts/01_export_pubmed_csv.py). As anticipated manual abstract analysis showed that a subset of flagged and acquired references was not relevant to the field of consciousness as opposed to the use of a MeSH as an indicator of level of arousal of human or animal study subjects. For example, many flagged studies referred to pharmacological, physiological or other interventions upon “conscious [rats, mice, sheep, monkeys, subjects]” while others referred to the presence or absence of consciousness as an indicator of coma or as a sequela to traumatic brain injury.

Based on the presence of such articles which ideally would be excluded from subsequent analysis, a system of parsing was developed beginning with a random sample of 300 flagged articles which were manually reviewed and annotated as ‘irrelevant=0’ or ‘relevant=1’ in an expanded .csv file (https://github.com/wjdavenport/FDC-Project-Backup/consciousness-ezr/scripts/02_make_seed_labels.py).

Analyze Progress: seed labels were applied in a “bag-of-words”⁸ linear text classifier implemented in Python (consciousness-ezr/scripts/03_train_baseline_and_ezr.py) using text feature of titles and abstracts as available (TfidfVectorizer, a scikit-learn module)⁹ and modelled via binary logistic regression (LogisticRegression, also a scikit-learn module)¹⁰. The choice of this type of classification scheme was to preserve interpretability (since positive- and negative-weighted n-grams are produced and preserved, for example as in Figure 2).

A second round of manual review of random sampling of retained and rejected (‘relevant’ - and ‘irrelevant’-labelled) references will be conducted after training to estimate accuracy of the training model. Further refinements can be considered if needed. Such refinements could include the explicit inclusion of known proposed named models of consciousness (e.g., Global Workspace Theory, Mind-Brain Identity Theory, Orchestrated Objective Reduction, Panpsychism, Monism, Dualism, Electromagnetic Theory, Neural Correlates, and so on) and further tests of elimination of “stop words” within the TfidfVectorizer. Additional inclusion features could include proper names of authors associated with theories of consciousness (e.g., Edelman, Crick and Koch, Dennett, Baars, McFadden, Searle, Chalmers) in abstracts, titles, or authors. It would also be possible to apply additional mini-models, including decision trees¹¹ or a previously considered rule-based learner (ezr¹²).

Progress update on **Constraints:** Thus far manual classification has been possible without recourse to bulk downloading of copyrighted references, and where questions of relevance arose (less than 2% in sampling), single-reference review was available through institutional access (either University of Illinois Urbana-Champaign or University of Calgary) for the <10 references reviewed) for research and educational purposes of this project.

Progress update on **Gaps:** The metadata available through PubMed does not include publicly available resources including books, recorded lectures, interviews, conference talks, preprints, dissertations and theses, and liberal arts fields (humanities and philosophy) of relevance. At this checkpoint in the Project, focus will remain on refining the current PubMed search results and analysis so that a similar selection process can be applied to such search extensions beyond this initial project.

Progress update on **Timeline:** the final report draft on the project presentable for feedback and commentary from instructors (as available) will be made by December 1, 2025, with final submission to occur by December 10, 2025.
